

# ETN AGM & WORKSHOP

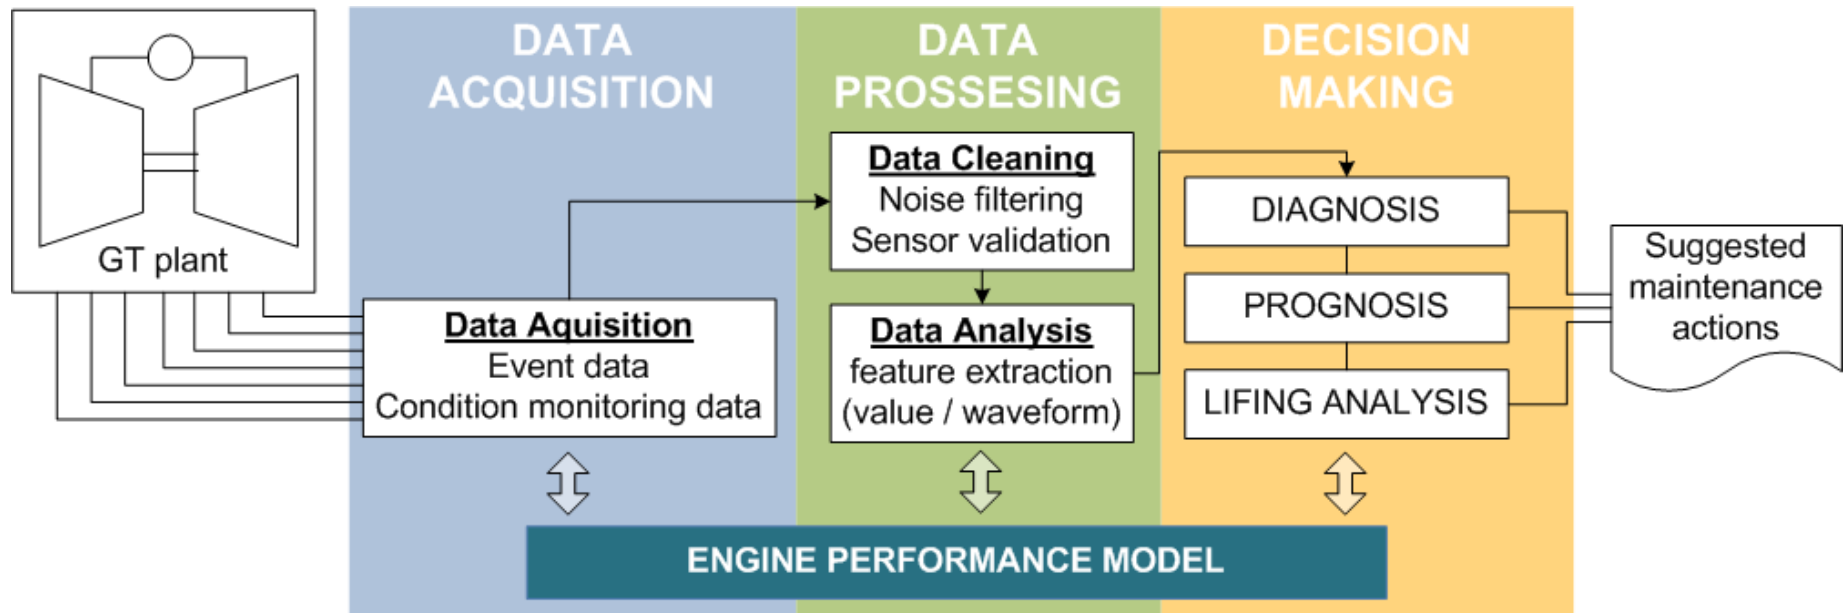

2-3 April, Paris La Defense, France

# **Condition Based Maintenance & Related GT modeling aspects**

**DR. CHRISTOFOROS ROMESIS**

National Technical University of Athens (NTUA)  
Laboratory of Thermal Turbomachines

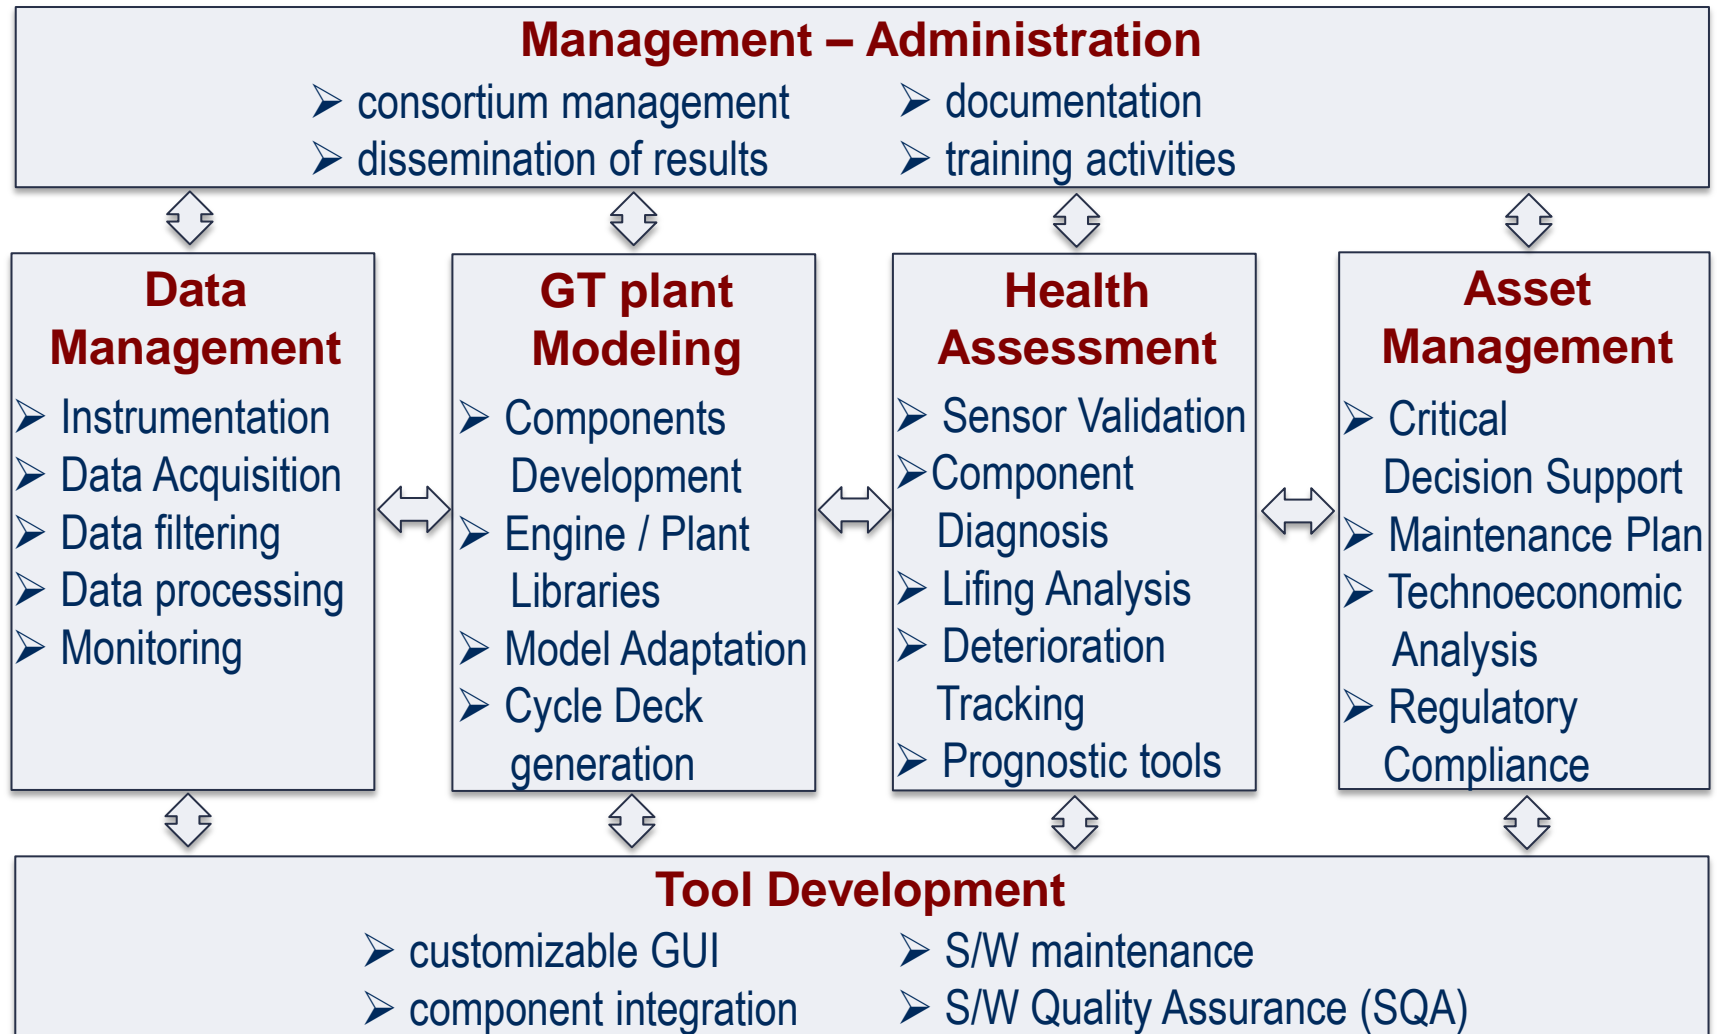

# Overview of the CBM approach

CBM is a maintenance approach, where maintenance actions are suggested, based on information collected through condition monitoring

# Proposed Project Structure

– initial approach –

# Questions Raised

- ❖ The development of a tool following the complete CBM sequence is a huge task to be covered by a single project, in terms of both required effort and cost
  - ❖ Some condition monitoring features, related to CBM, may be of little interest to users or is already covered by existing tools
- 
- ❖ Need of mapping current practices and available tools for GT plants condition monitoring
  - ❖ Identify any technological gap and CBM related issues of interest

## **Questionnaires**

created by NTUA and CU, towards ETN partners

# Questionnaires structure

## GT users and O&G industry

**Current Maintenance Approach**  
Breakdown | Preventive | Predictive

### **Software related questions**

How is developed?  
How is currently used?  
How data can be exported?

### **Condition Monitoring features**

Features currently available?  
Desired features?  
How to be integrated?

**Concerns**  
**Additional Comments**

## OEMs, R&D, suppliers & service providers

**Condition Monitoring activities**  
software | tools | services

**Condition Monitoring features**  
currently available

**Condition Monitoring features**  
to be developed within the frame of  
a CBM project

**Concerns**  
**Additional Comments**

# Questionnaires Responses

In total, 19 questionnaires feedback were received by partners  
Oil&Gas (2) – Utilities (3) – OEM (1)  
R&D institutes (5) – Suppliers & Service providers (8)

# Questionnaires Responses

## GT users and O&G industry

**Current Maintenance Approach**  
Breakdown | Preventive | Predictive

### **Software related questions**

How is developed?  
How is currently used?  
How data can be exported?

### **Condition Monitoring features**

Features currently available?  
Desired features?  
How to be integrated?

**Concerns**  
**Additional Comments**

## OEMs, R&D, suppliers & service providers

**Condition Monitoring activities**  
software | tools | services

**Condition Monitoring features**  
currently available

**Condition Monitoring features**  
to be developed within the frame of  
a CBM project

**Concerns**  
**Additional Comments**

# Questionnaires Responses

– GT users and O&G industry –

## Current Maintenance Approaches

### Breakdown Maintenance

maintenance actions are taken only after breakdown / when fault occurs.

### Preventive Maintenance

maintenance actions are taken after specific time intervals of operation, regardless of the condition of the engines, unless a machinery issue occur in the meantime.

### Predictive Maintenance

maintenance actions are planned and taken according to the actual condition of the operating engines, which is assessed through appropriate condition monitoring procedures.

# Questionnaires Responses

– GT users and O&G industry –

## Software related questions

		 Statoil			
In-house developed software					
Software developed by GT manufacturer					
Software developed by third party					

- ❖ In 80% of users, available software allows real-time data exports
- ❖ Users are either consulted their condition monitoring software, for maintenance planning, to detect an event at an early stage, or when an event has already occurred.

# Questionnaires Responses

– GT users and O&G industry –

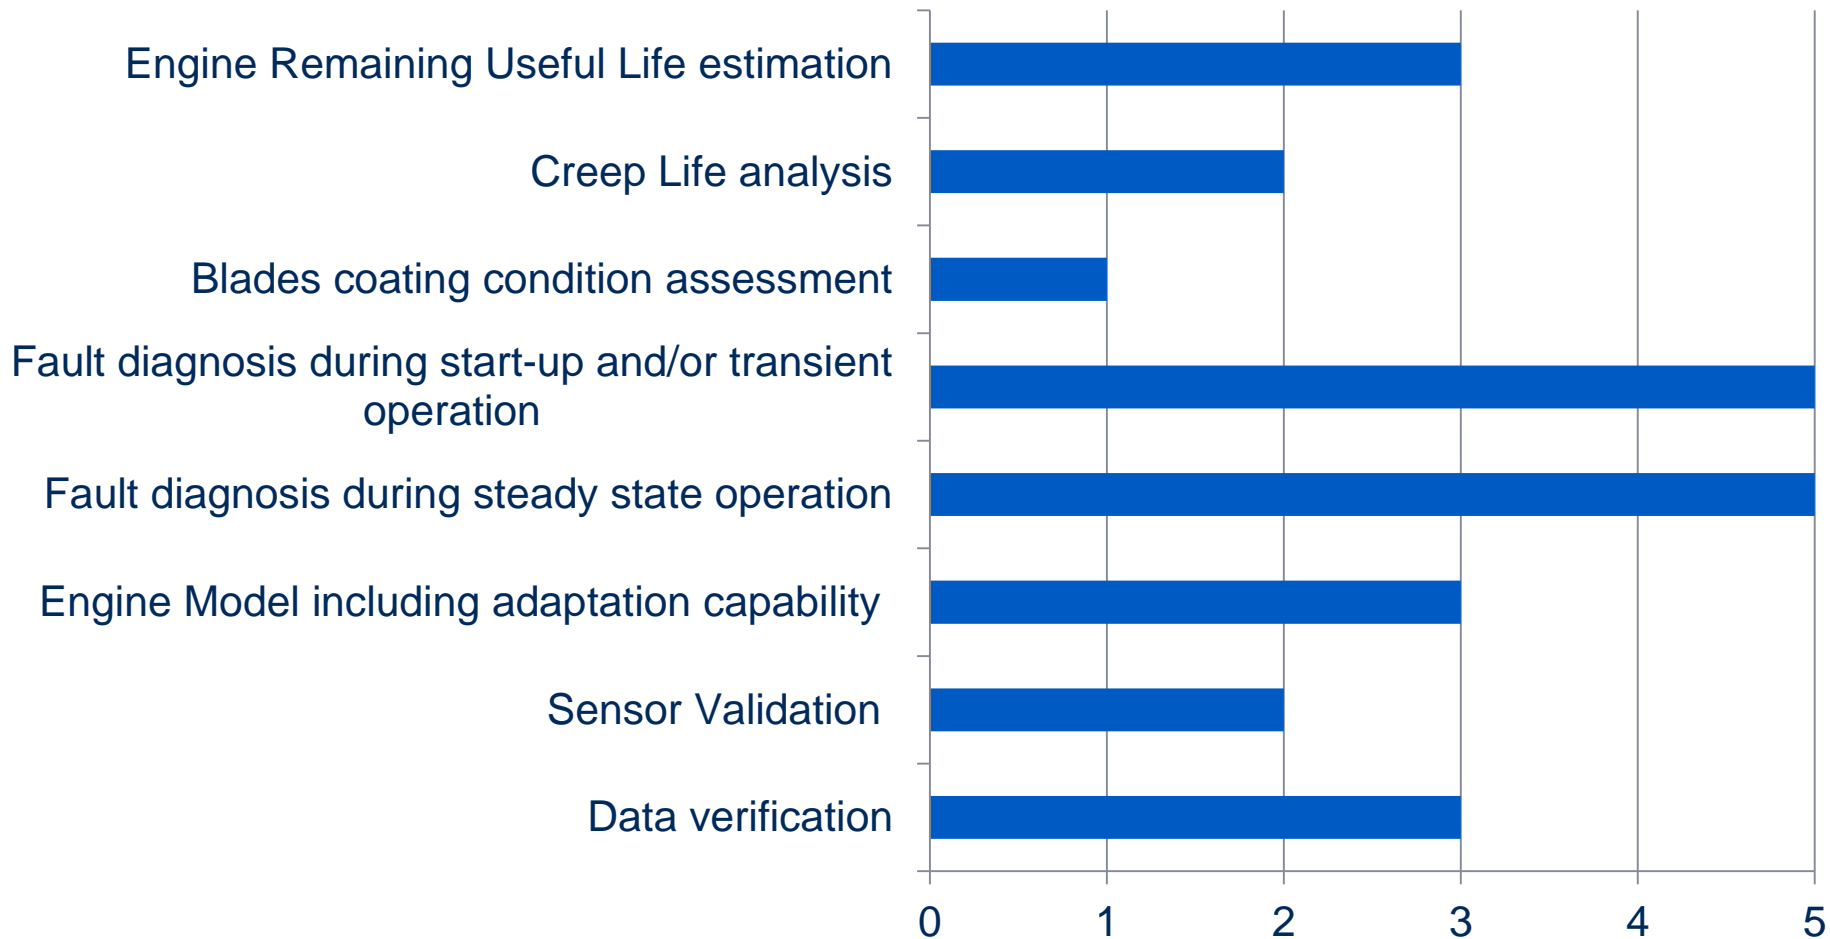

## Current Condition Monitoring features

# Questionnaires Responses

– GT users and O&G industry –

## Desired Condition Monitoring features

# Questionnaires Responses

## GT users and O&G industry

### **Current Maintenance Approach**

Breakdown | Preventive | Predictive

### **Software related questions**

How is developed?

How is currently used?

How data can be exported?

### **Condition Monitoring features**

Features currently available?

Desired features?

How to be integrated?

### **Concerns**

**Additional Comments**

## **OEMs, R&D, suppliers & service providers**

### **Condition Monitoring activities**

software | tools | services

### **Condition Monitoring features**

currently available

### **Condition Monitoring features**

to be developed within the frame of  
a CBM project

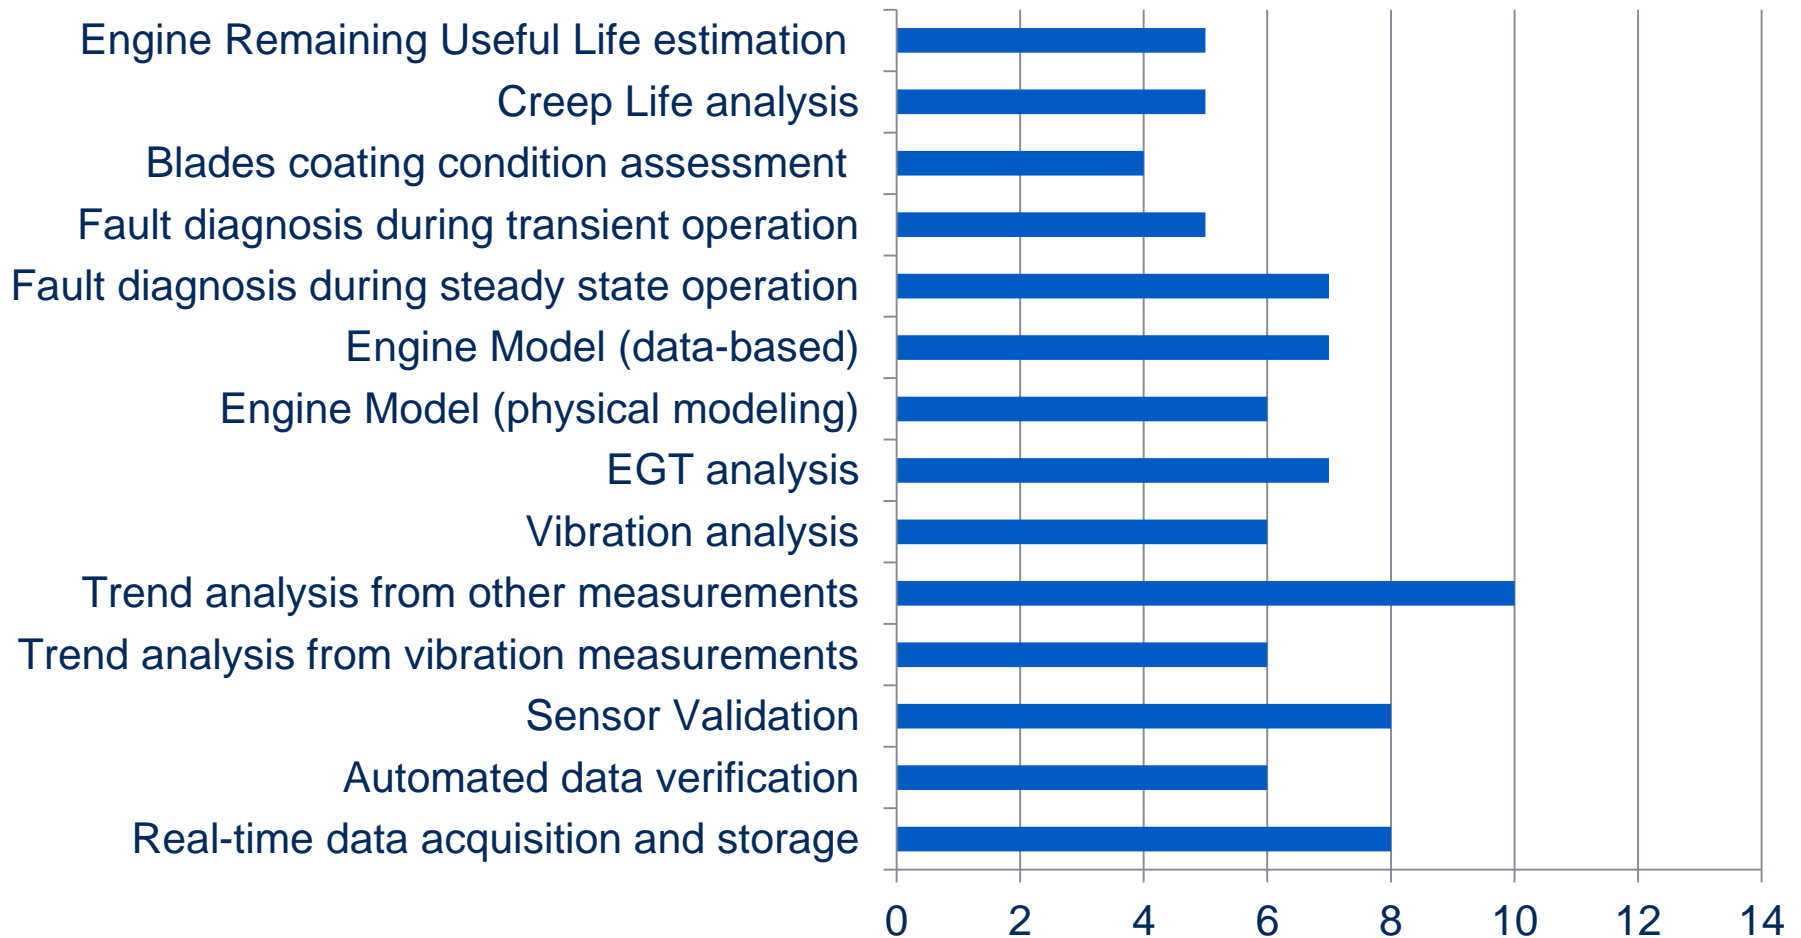

### **Concerns**

**Additional Comments**

## Provided Condition Monitoring Activities

## Available Condition Monitoring features

## Condition Monitoring features partners could contribute

# Concerns & Comments

## ❖ Confidentiality issues

Important, but cannot be addressed at the moment, since the project structure and the consortium are not yet defined

## ❖ Usefulness of the outcome

Tools already exist, but users are missing condition monitoring features. Also OEM expresses the interest in incorporating advanced methods & techniques

## ❖ Required OEM participation – Service providing

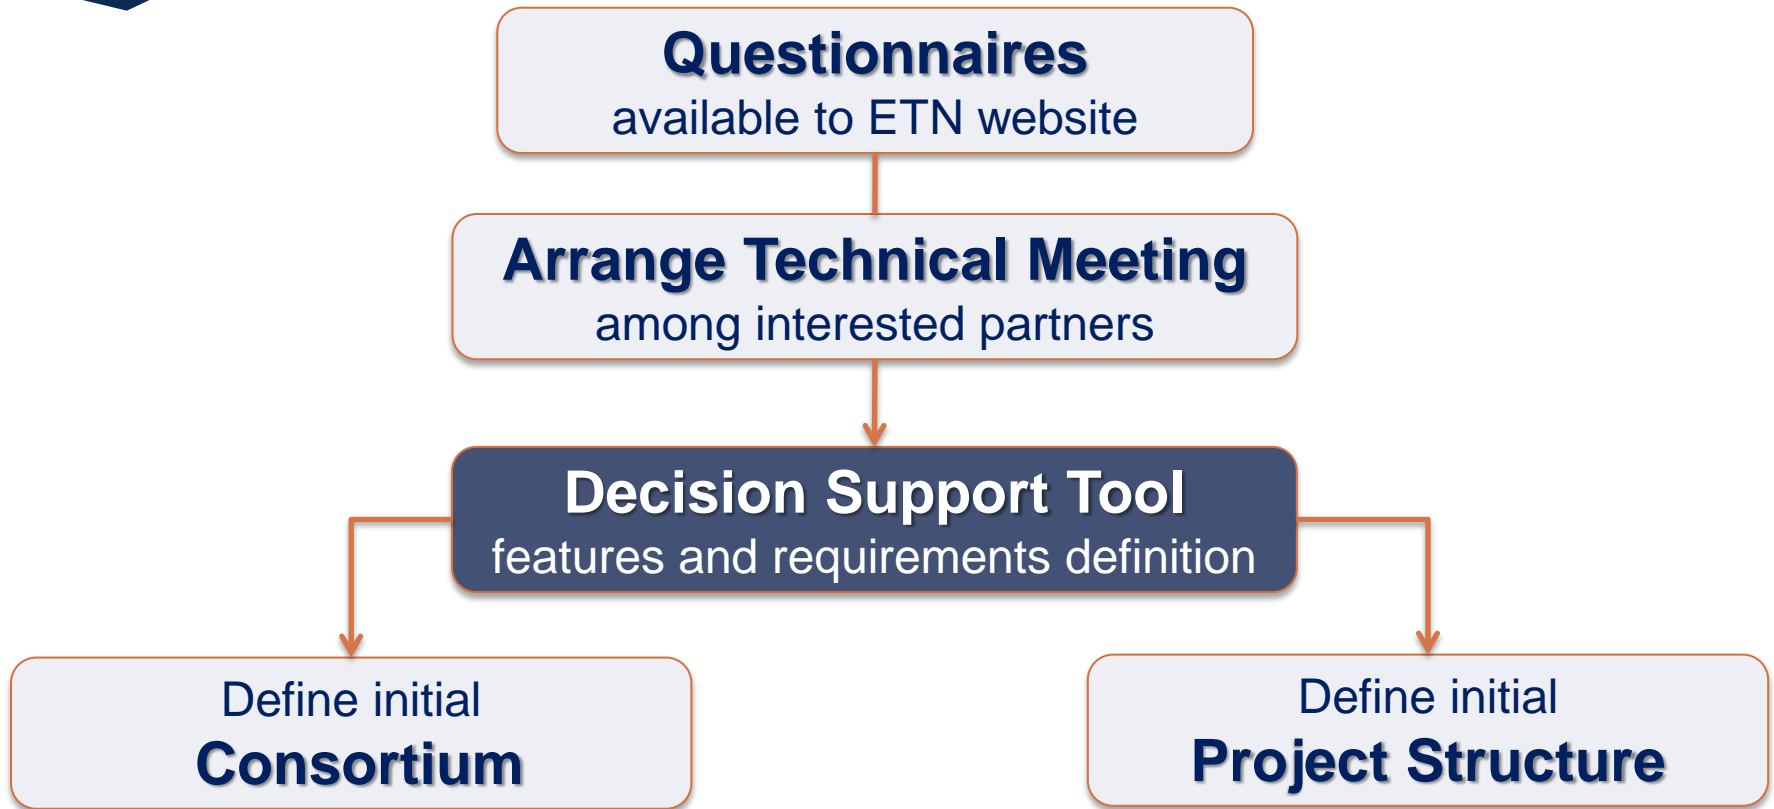

Output of the project will be a decision-support tool. Whether this is a stand-alone tool for users or integrated to OEMs' and service providers systems, depends on the consortium.

- distinction should be made between fault detection (short term, quick actions) and maintenance considerations (long term)
- Additional measurements would improve the capabilities of condition monitoring techniques

# Questionnaires conclusions

- ❖ ETN partners form a pool of developers that can cover all aspects of a CBM tool
- ❖ Users on the other hand are interested in seeing the considered features, either incorporated into their existing systems, or as a stand-alone tool
- ❖ OEM is also interested in the project idea:  
*“In case that the commercial issues mentioned below (in the questionnaire, Ed.) can be resolved there is considerable interest in supporting all the mentioned areas”*
- ❖ A realistic output would be the development of a Decision Support tool, focused on Diagnosis (steady-state, transient) and Prognosis
- ❖ Consortium scheme is still open
- ❖ Confidentiality issues must be addressed

# Way forward

We need to move into more technical details, to clarify final product features. This would allow partners to express their particular interest and us to propose a project structure

# **Gas Turbine modeling aspects related to CBM**

# Engine Performance Modeling

## current state-of-the-art

There is currently a multitude of commercial and in-house codes across Europe

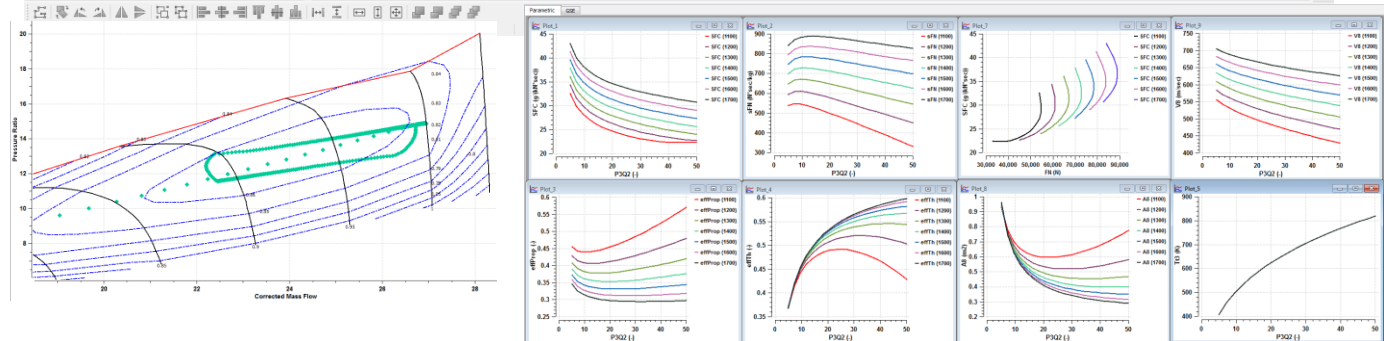

Current state-of-the-art will be presented using PROOSIS,  
**a tool developed in Europe for the European Gas Turbine Industry**

### PROOSIS

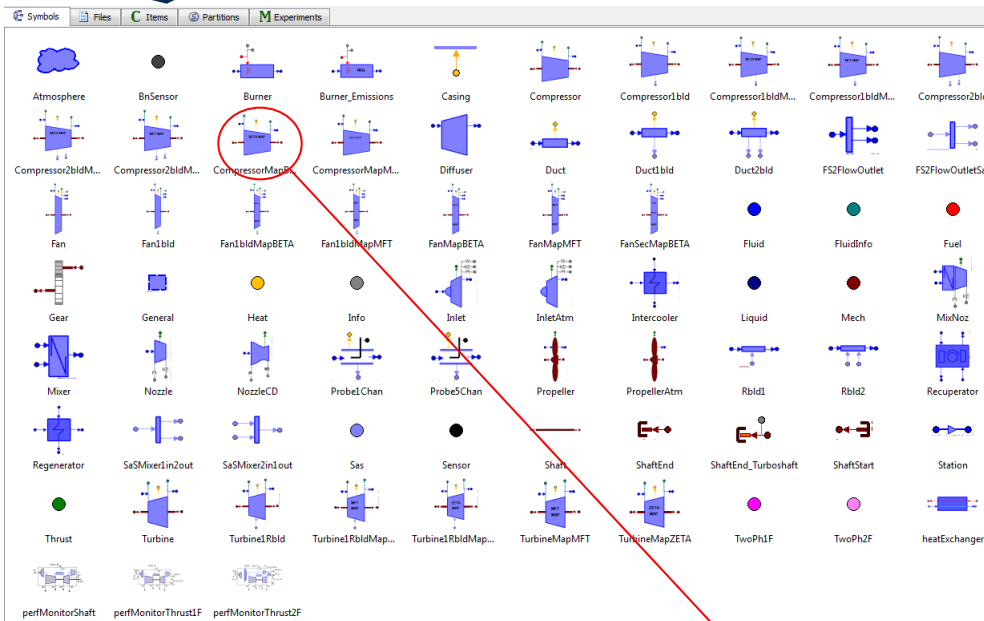

Developed in European Research Project **VIVACE** (2004-2007) by a consortium of European Universities (NTUA, CU & USTUTT), Research Institutes and corporate companies (Empresarios Agrupados Int., Snecma, MTU, AVIO, ITP, Turbomeca, Airbus France)

The ultimate goal for PROOSIS is to reduce development time and costs in all types of gas turbine or propulsive systems by becoming a **common simulation environment**, providing shared standards and methodologies for everybody involved in European gas turbine engine research and development programs. Current users include Airbus, SAFRAN (Snecma, Turbomeca, TechSpace Aero), European Universities & Research Institutes

- ## Advanced Graphical User Interface

# TURBO library of gas turbine components

- ❑ Industry-accepted performance modelling techniques
- ❑ Respects international **standards** in nomenclature, interface & OO programming

# Generic and Existing Engines library

Turbomeca Makila-1A1

GE LM2500-30

Siemens V64.3

IAE-V2500-A1

Rolls-Royce Olympus

GE PG9171E

Rolls-Royce TRENT-772B

Rolls-Royce Tyne

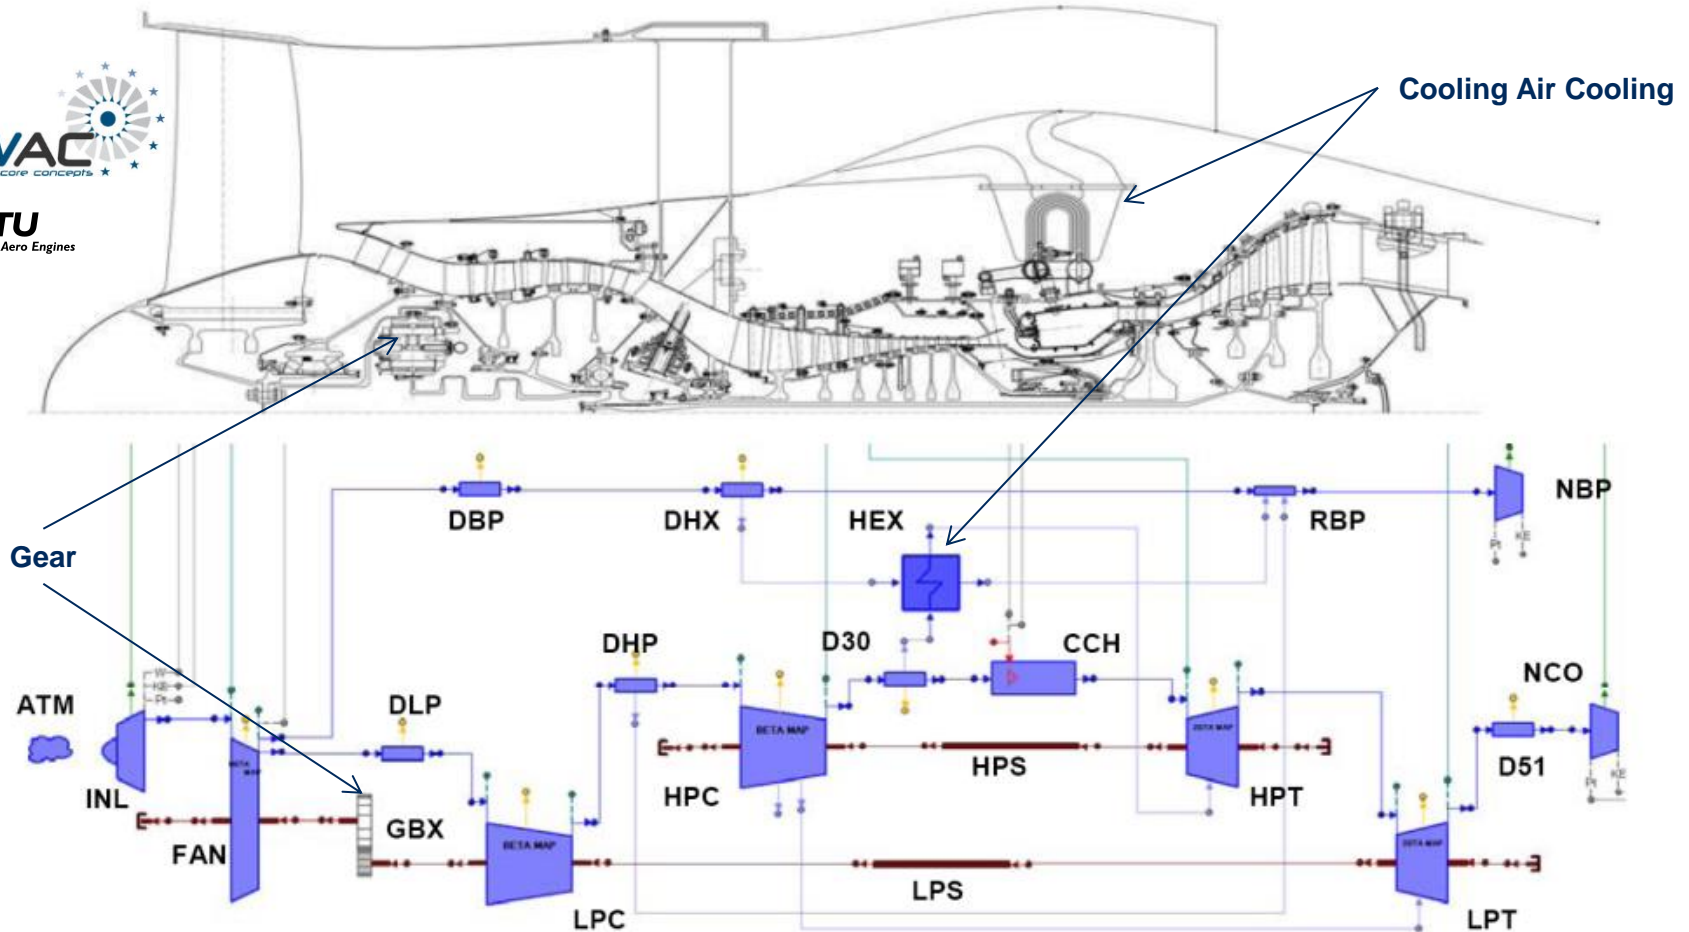

GE LM6000

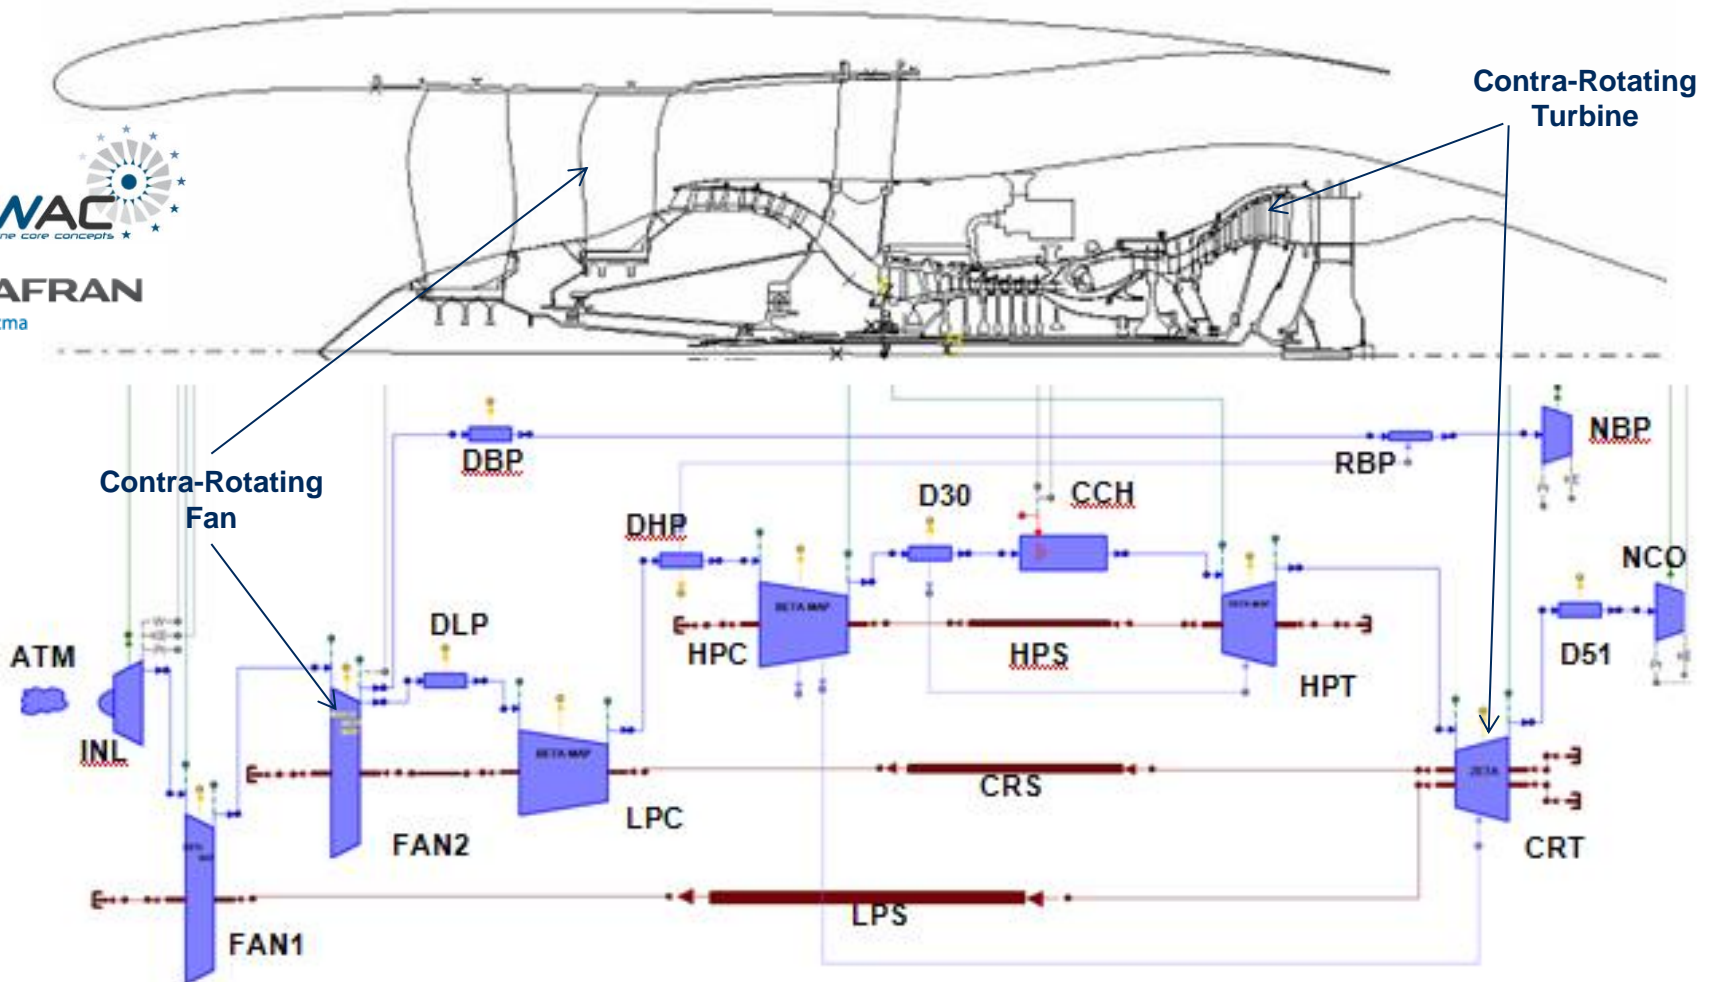

# Modeling Concept GT Configurations

## Geared Turbofan with Active Core Technologies

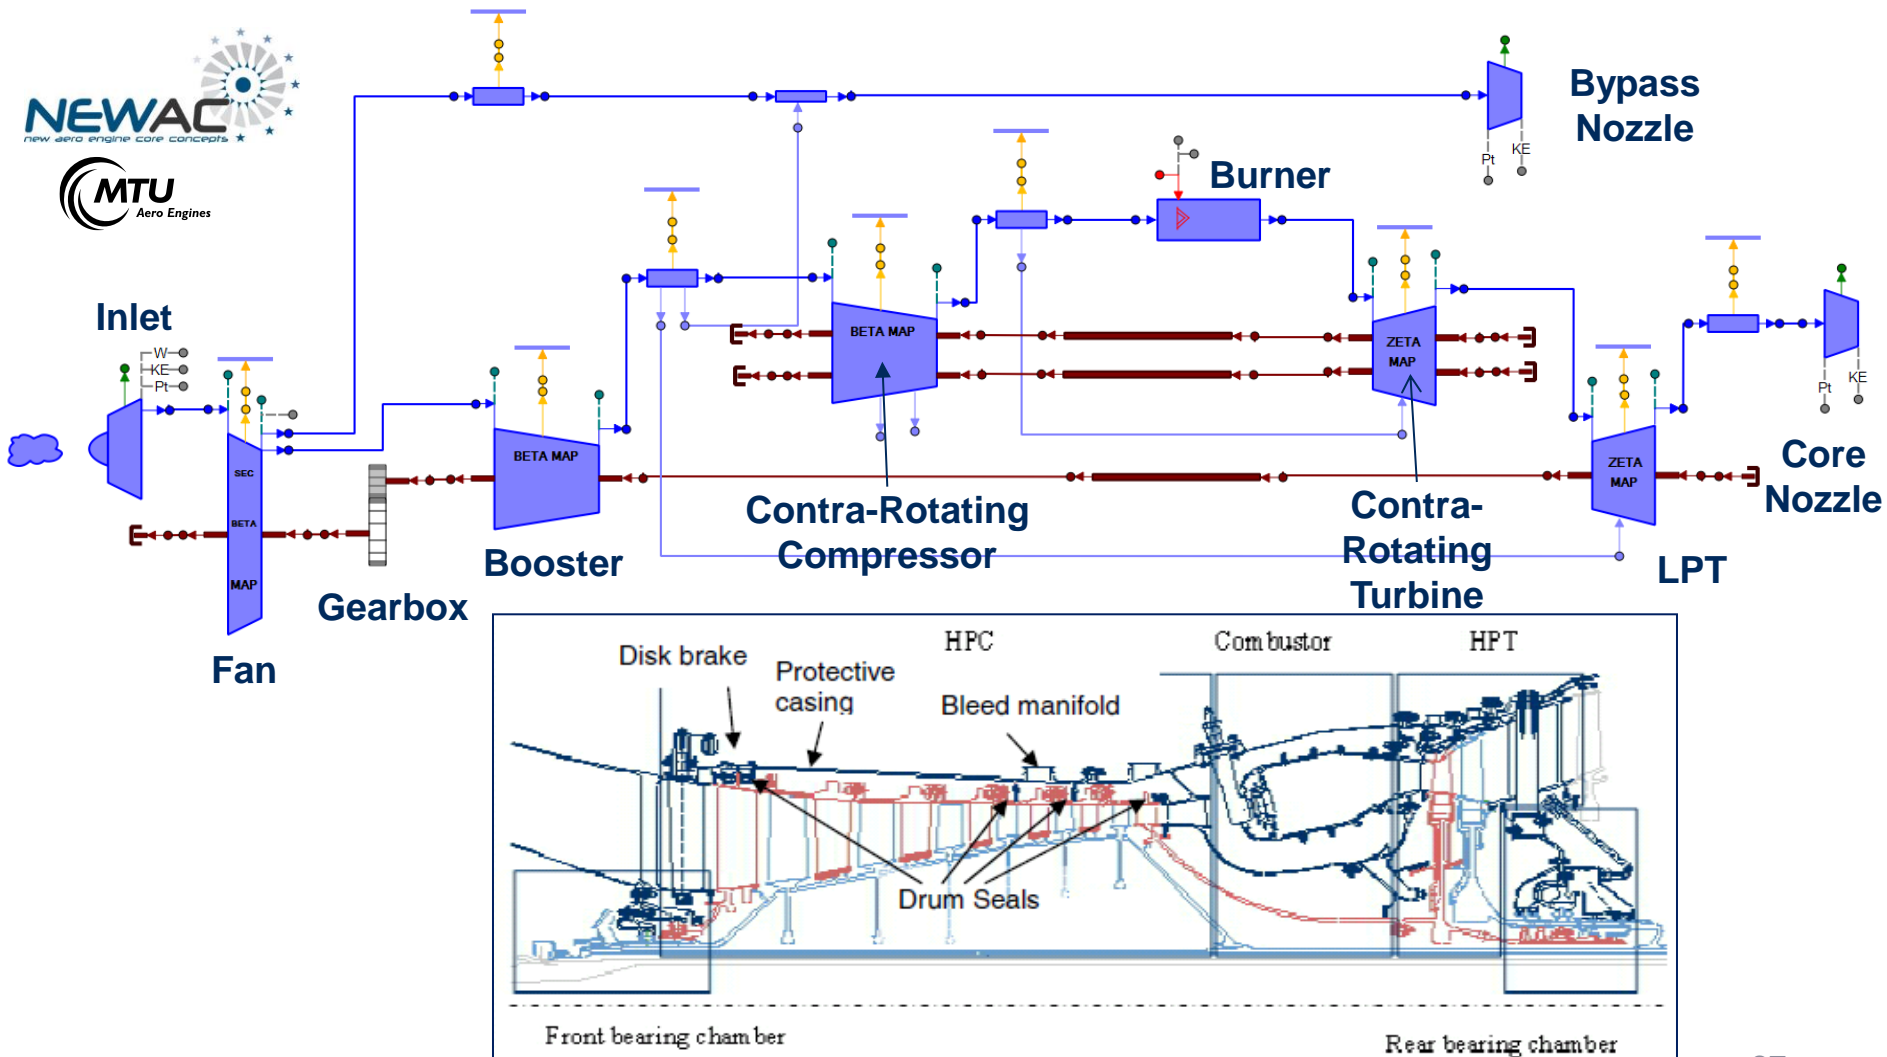

Active Cooling Air Cooling (ACAC) aim:  
reduce HP turbine cooling air consumption at cruise while maintaining its cooling potential at take-off

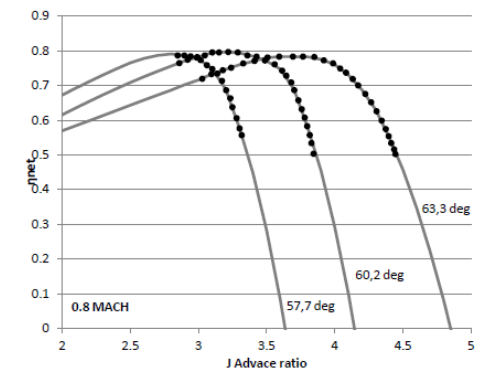

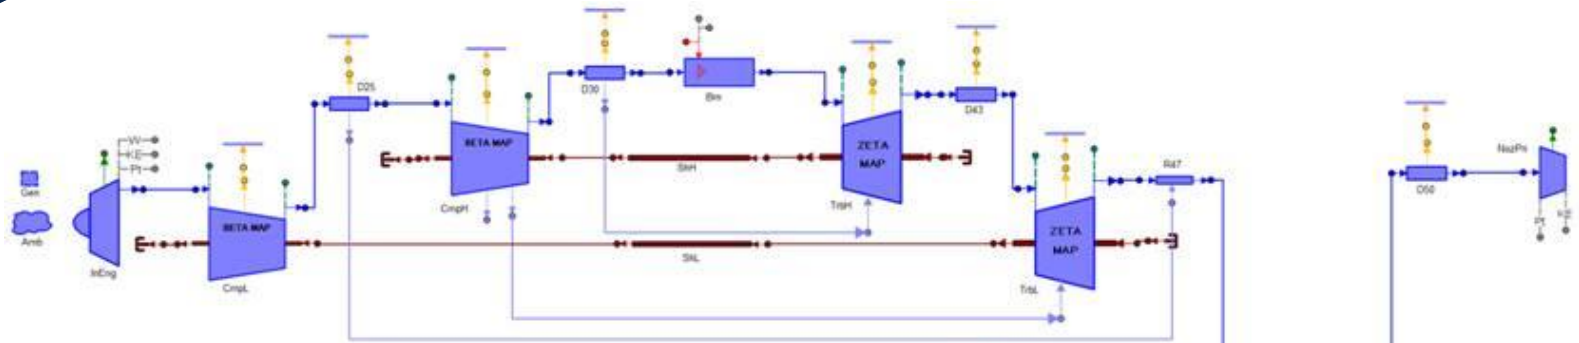

# Modeling Concept GT Configurations

## Contra-Rotating Core Geared Turbofan

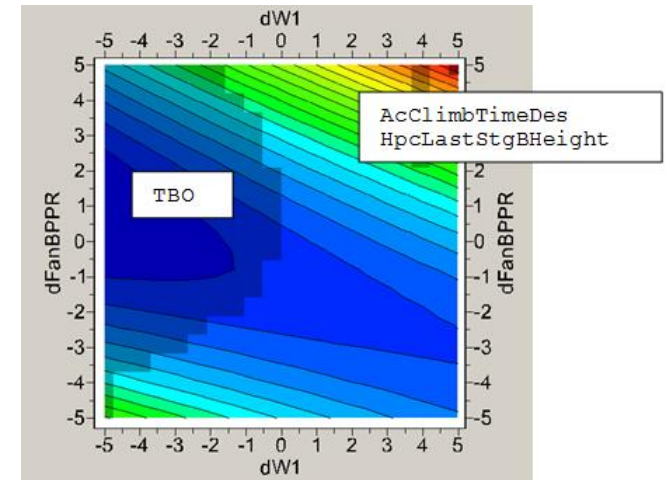

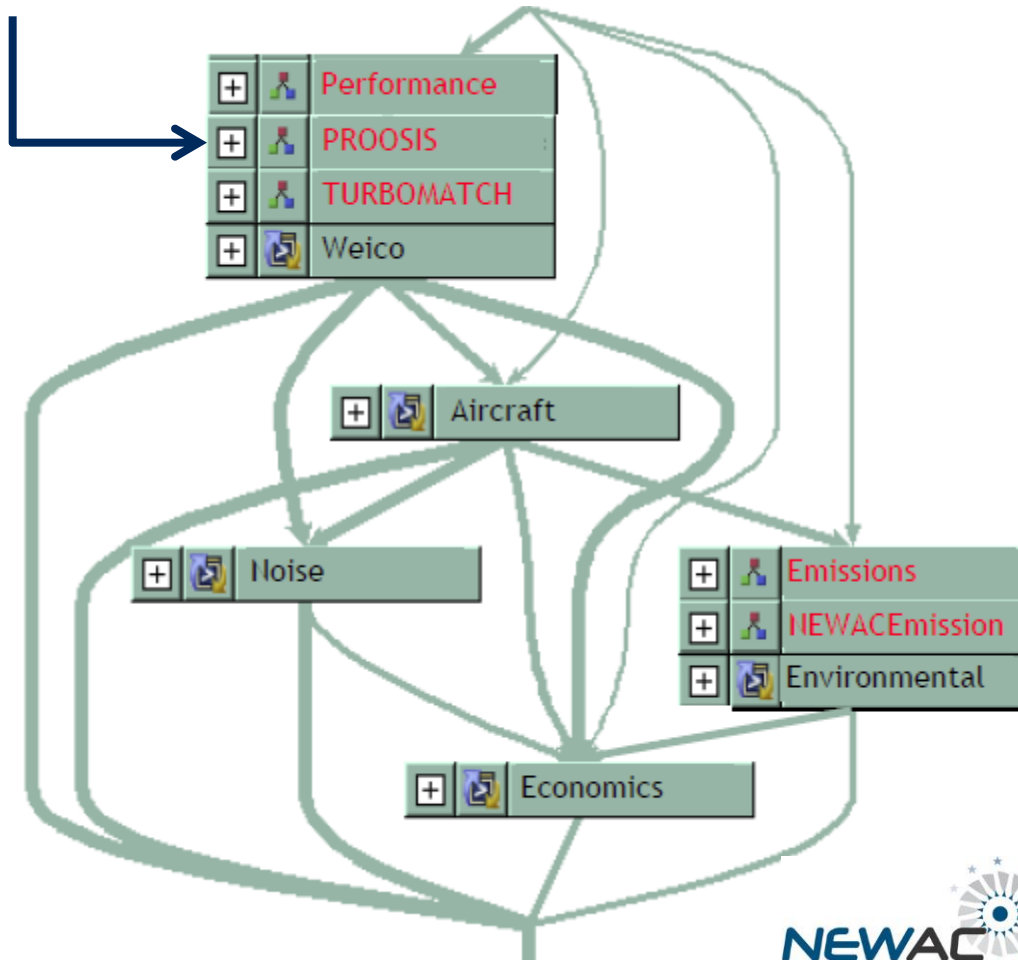

# Modeling Concept GT Configurations Open Rotor

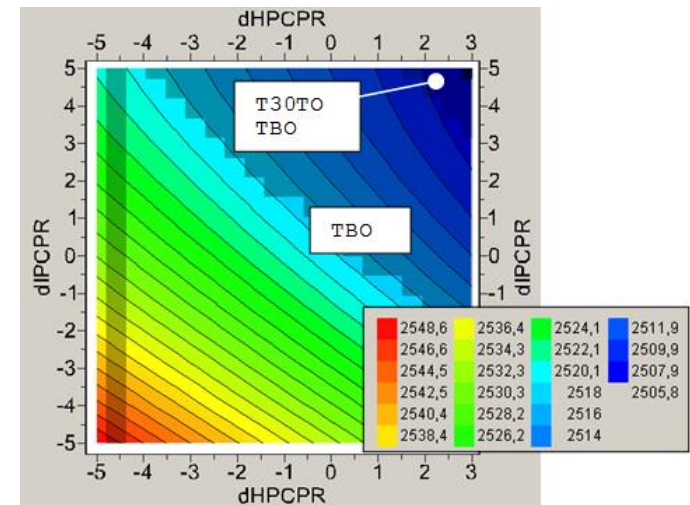

# Multi-Disciplinary Design Optimization

PROOSIS executable deck in iSIGHT

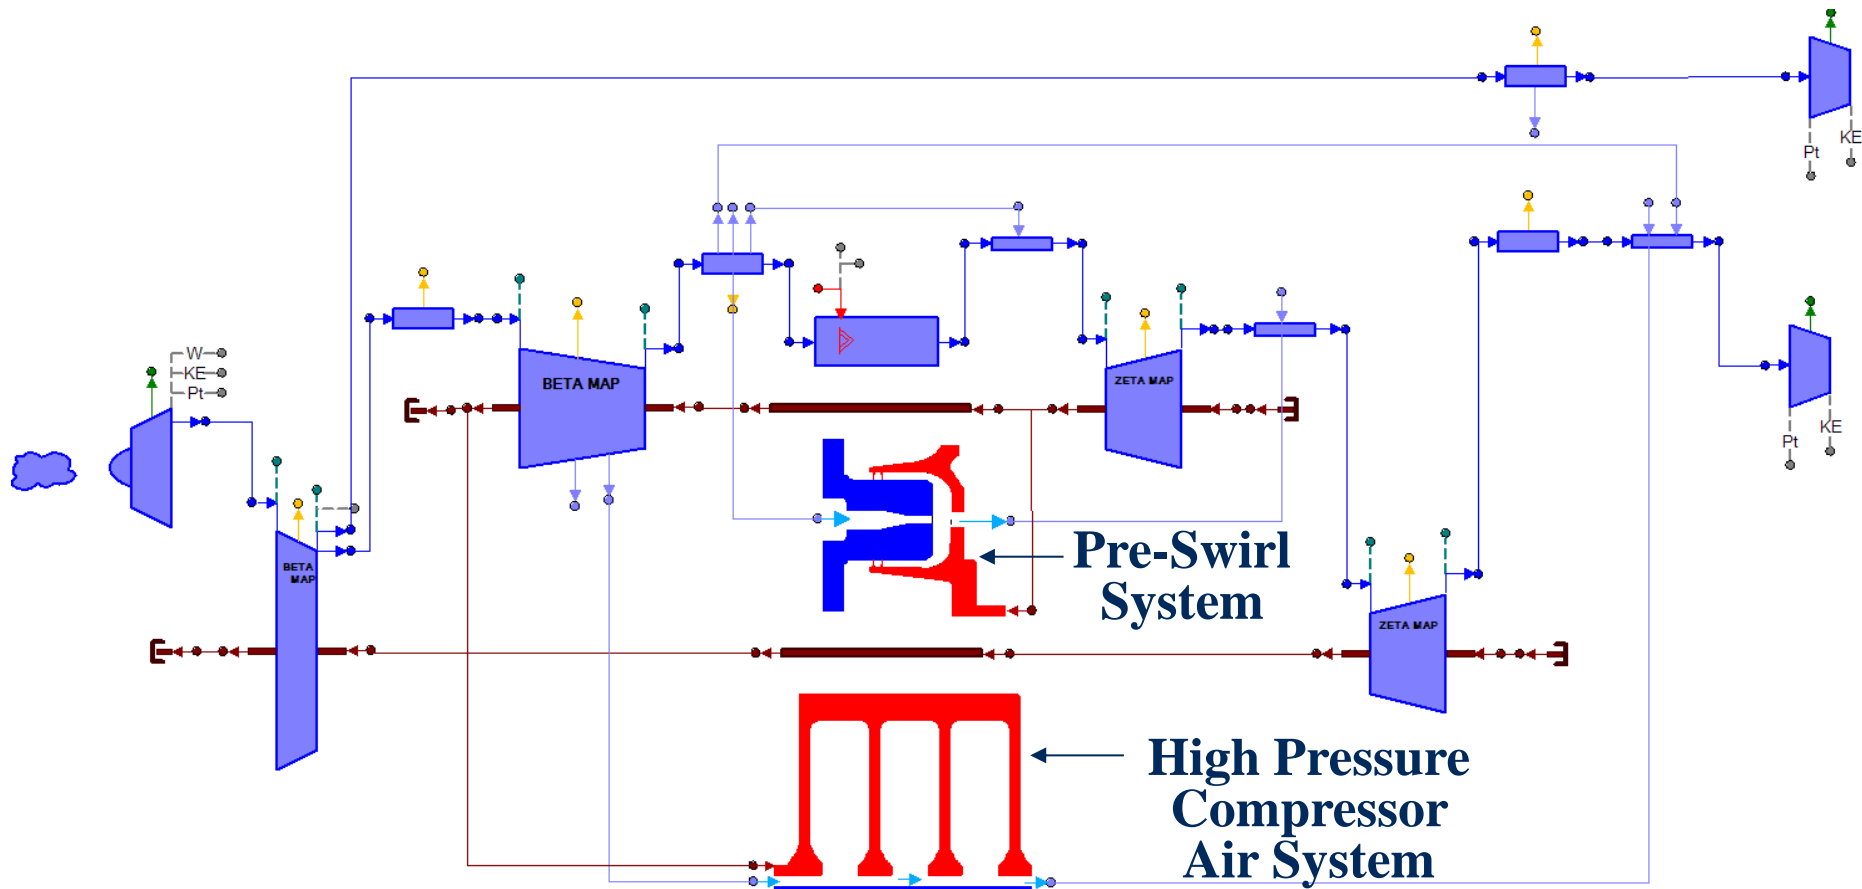

Fuel Burn Contour Plots

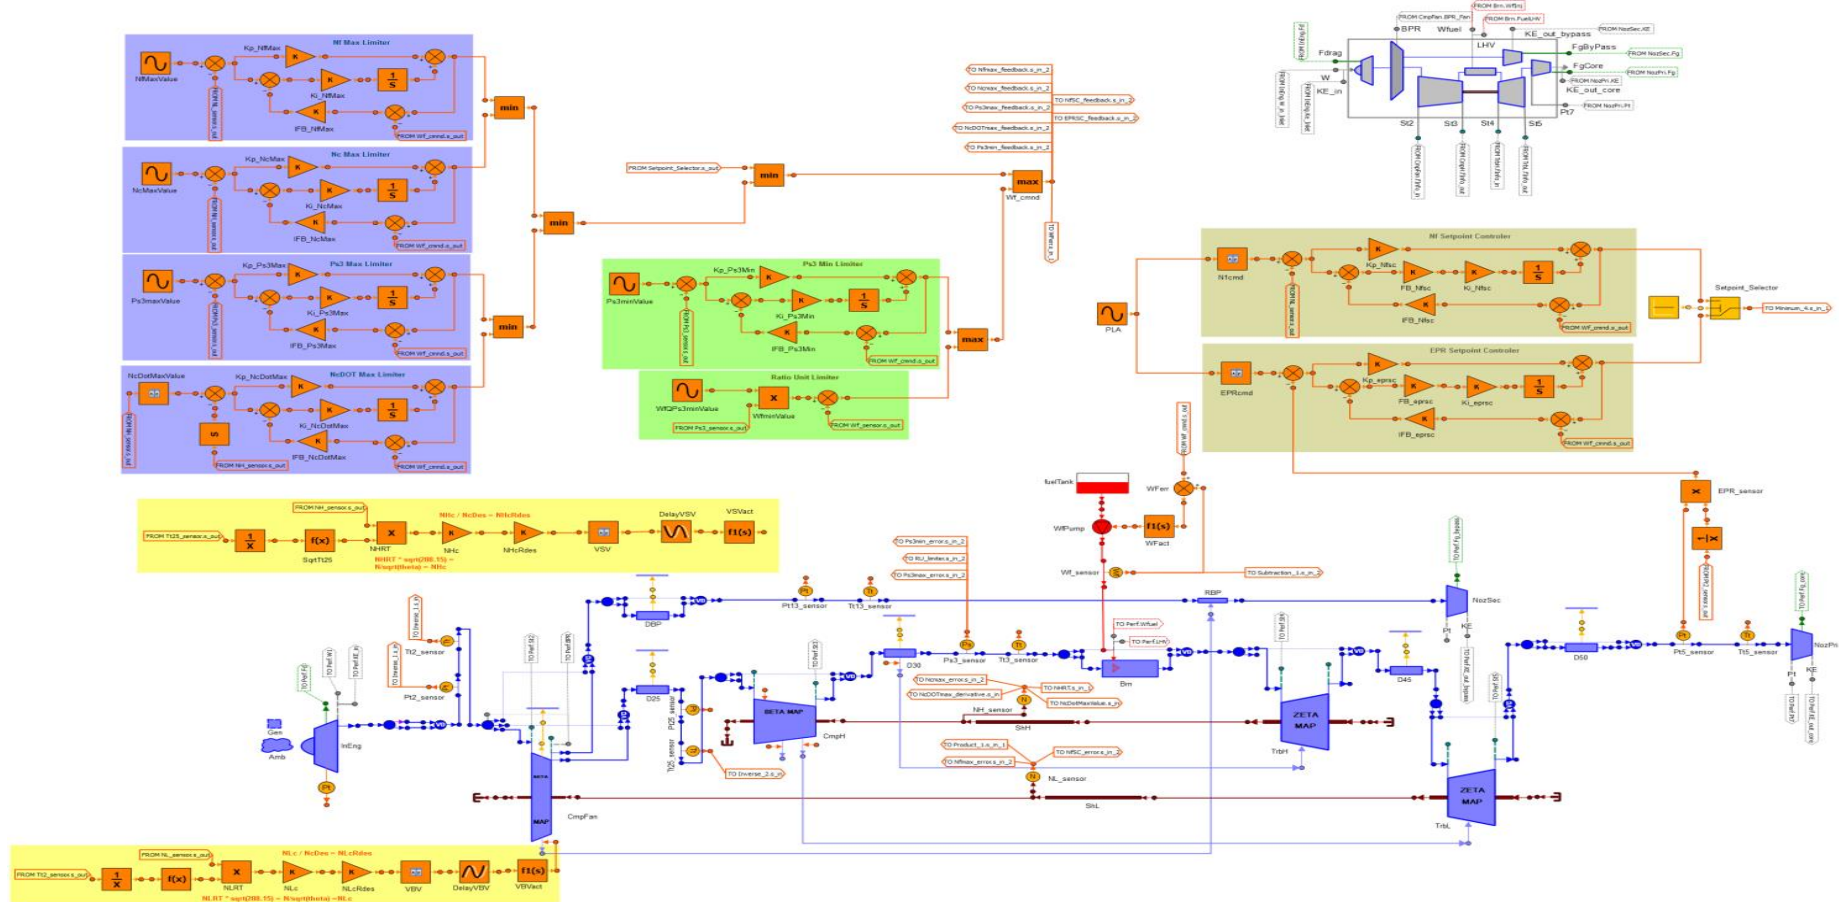

# Secondary Air System Modeling & Integration in Engine Model

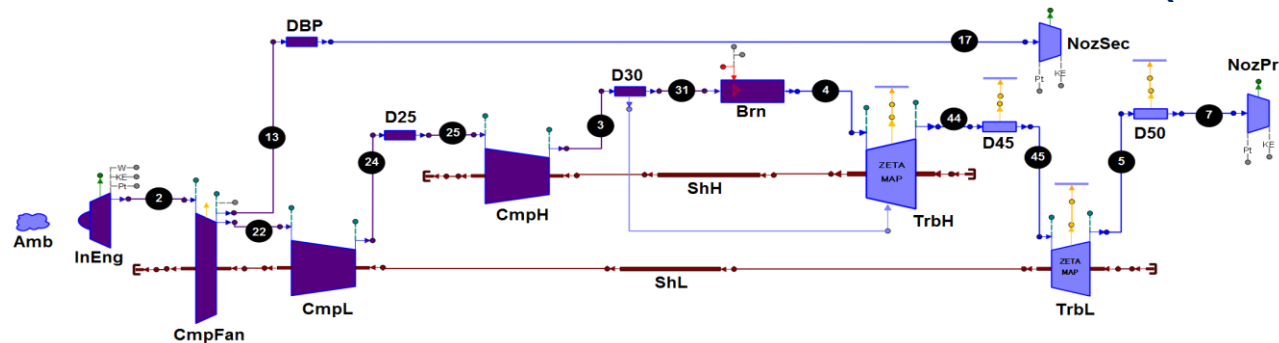

# Transient Simulations

Full transient simulation capability including: Shaft dynamics, Heat soakage, Volume dynamics, Sensor & actuator dynamics, Control system

# Mixed-fidelity modeling

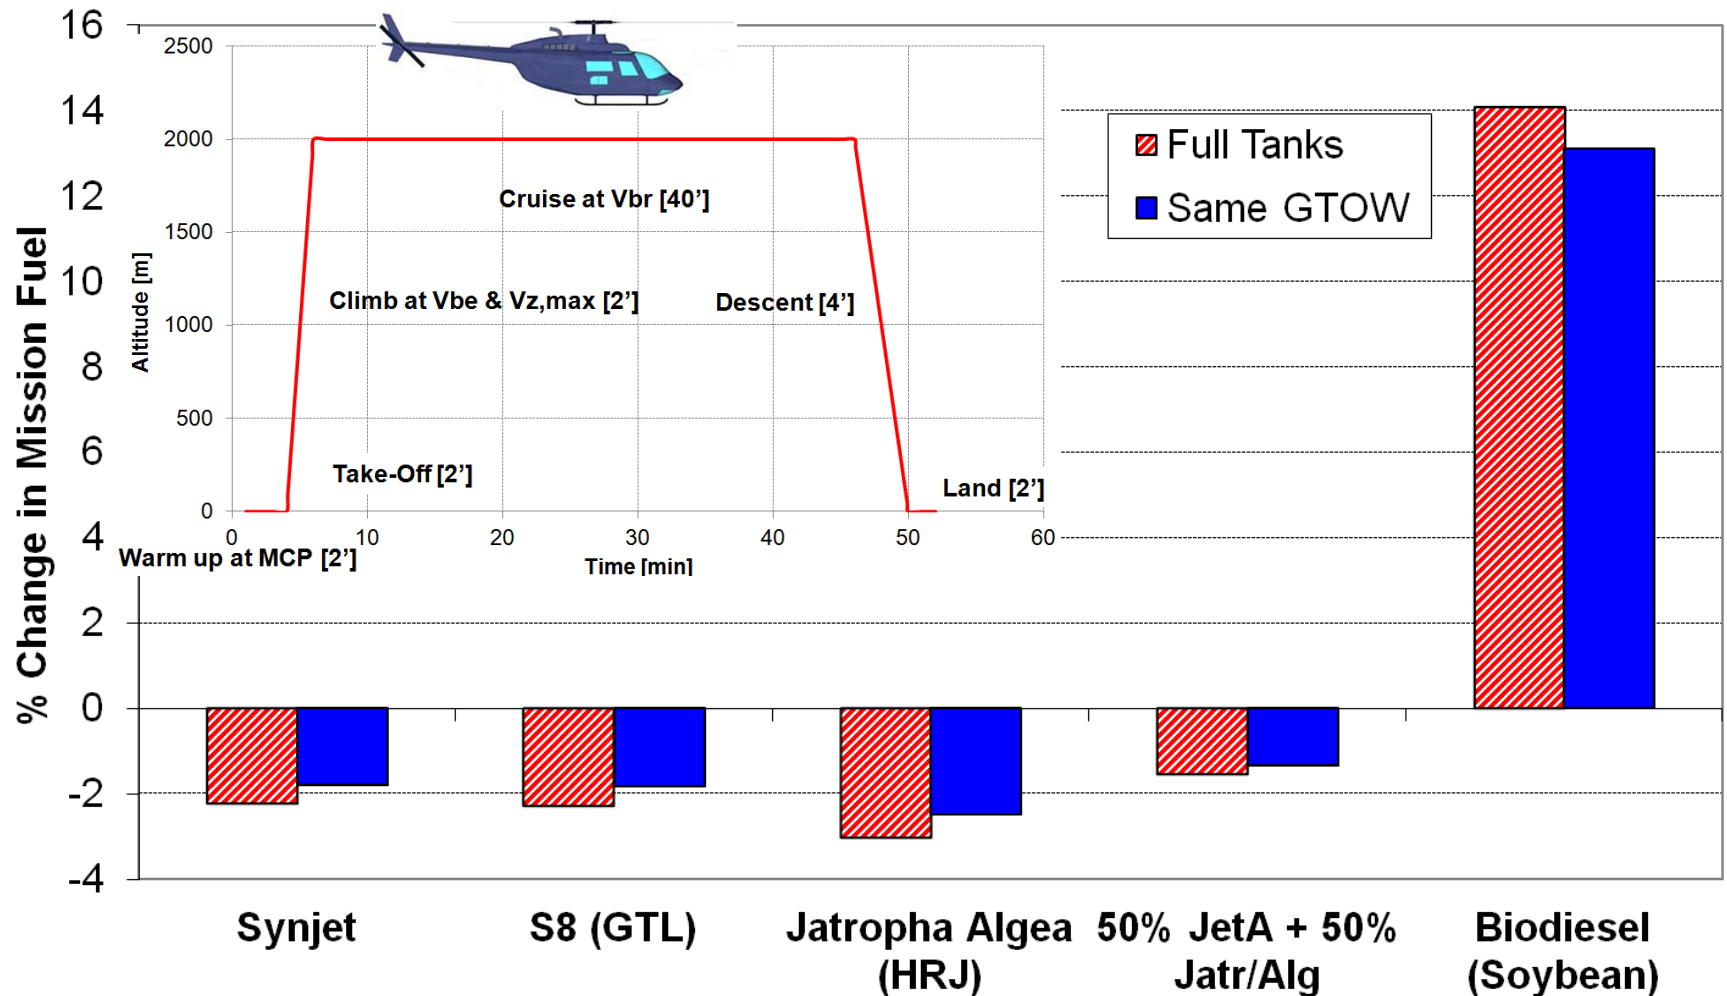

## Rain Ingestion Simulation Example

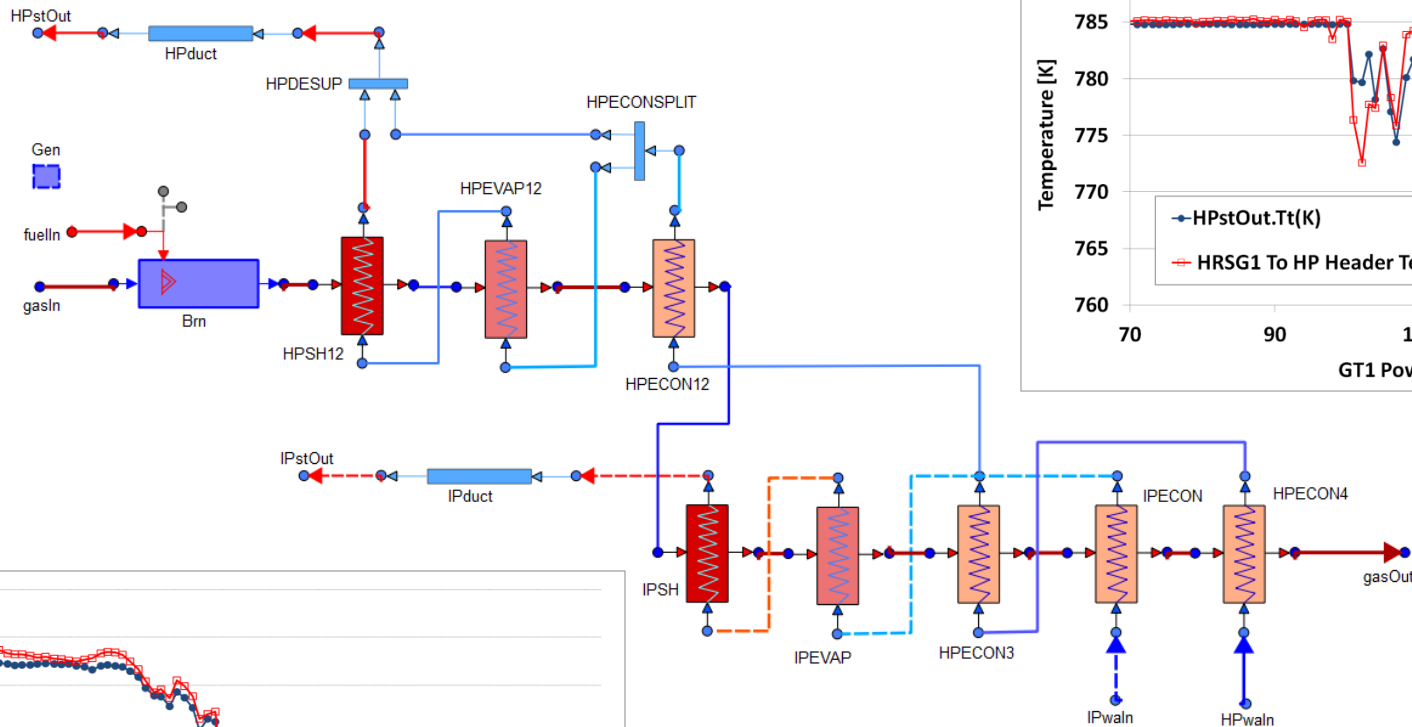

# Operation with Alternative Fuels

## Effects on Helicopter Mission

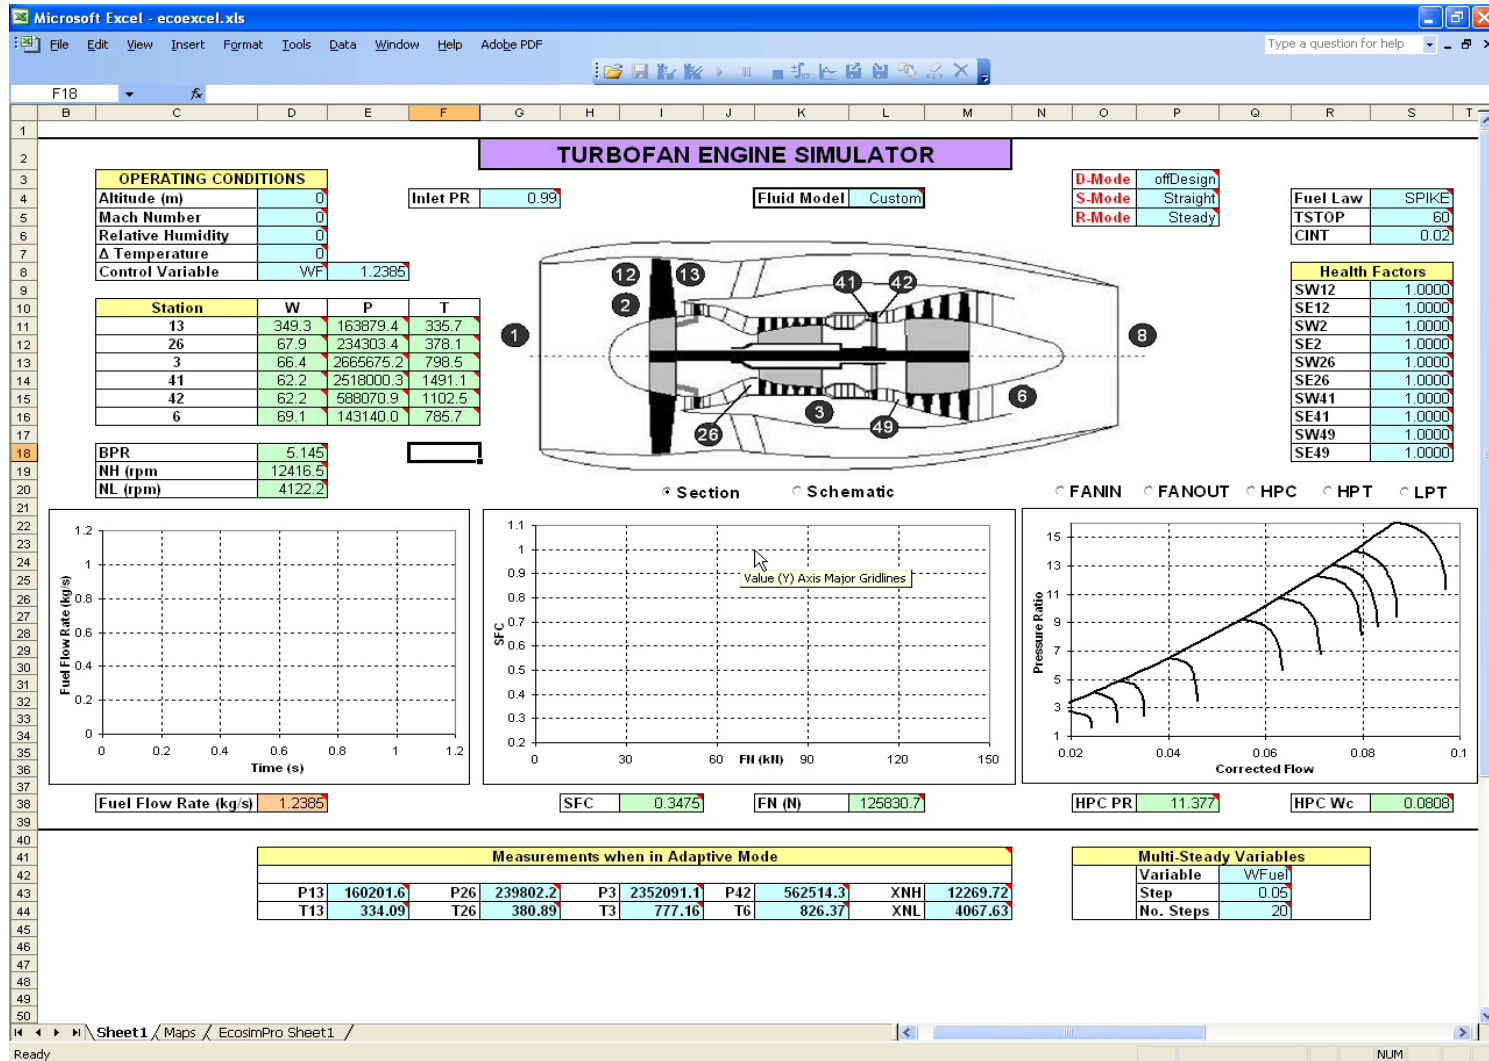

# Combined Cycle HRSG Simulation

**GT1**

# Simulation in Excel

# Models Adapted to Engine Specific Data Using Built-In Parameter Estimation Wizard

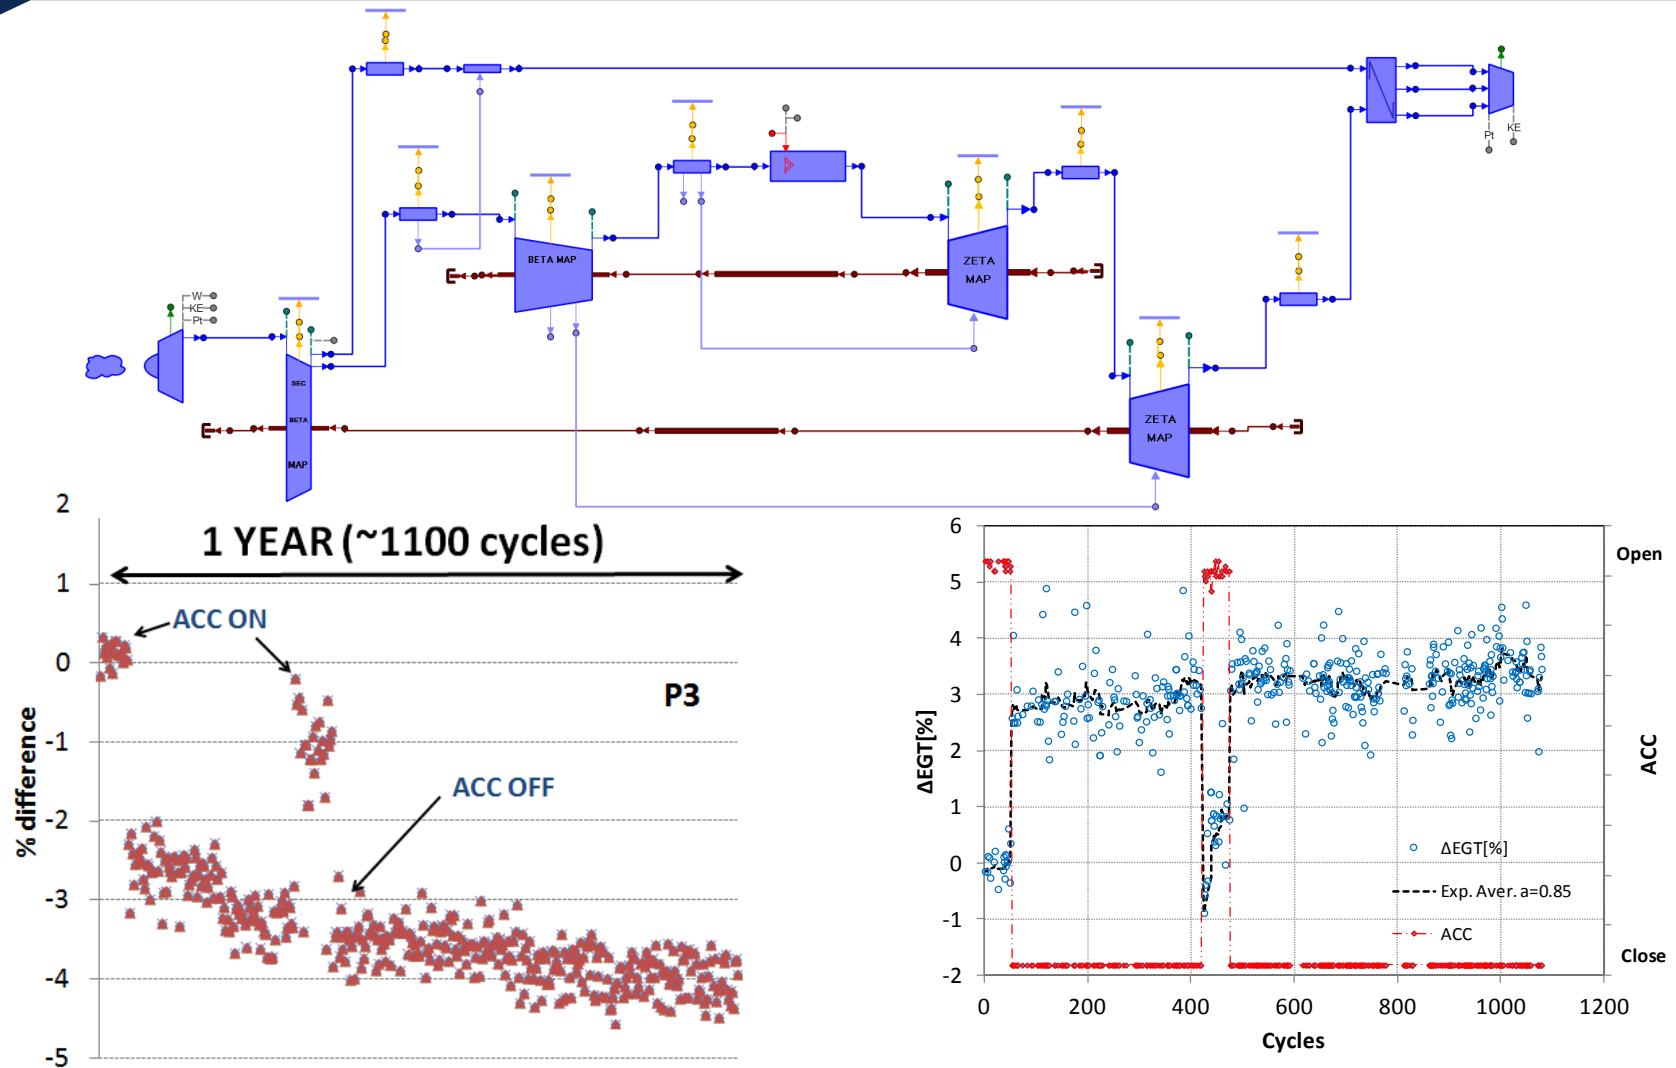

Adapted Industrial GT

Adapted Civil Aero-Engine

# From adapted model to diagnosis

# Diagnostic Systems

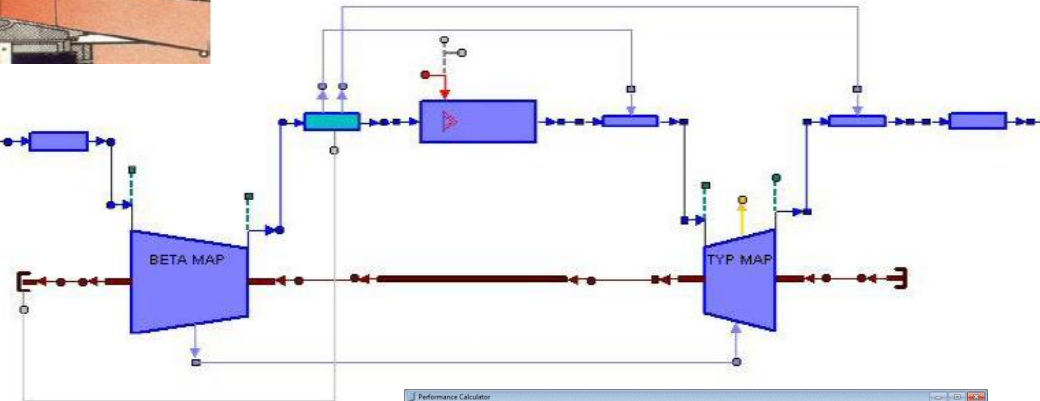

**On engine Measurements**

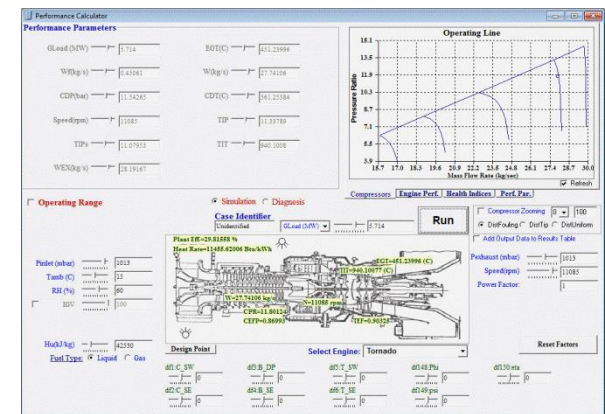

**Diagnosis**

**PROOSIS  
Engine Model**

**Monitoring  
System**

# Thank you!
